

Refrigerator Main Control Board Replacement and Cutting J1 pin 2.

Questions are often asked about cutting the wire in J1 pin 2 when replacing the main control board on certain models of refrigerators. There is only one situation that requires the wire to be cut:

If the refrigerator main board is mounted vertically (as shown below), **AND** there are wires in **both** pin 1 and pin 2 of J1, **Cut the wire in J1 pin 2.**

Note: When cutting the wire, leave enough wire to reconnect if necessary!

- There are no other situations that require J1 pin 2 to be cut.
- Many main boards look alike, always check the part number in IPC before installing.

Vertically Mounted Control Board
