Service Bulletin

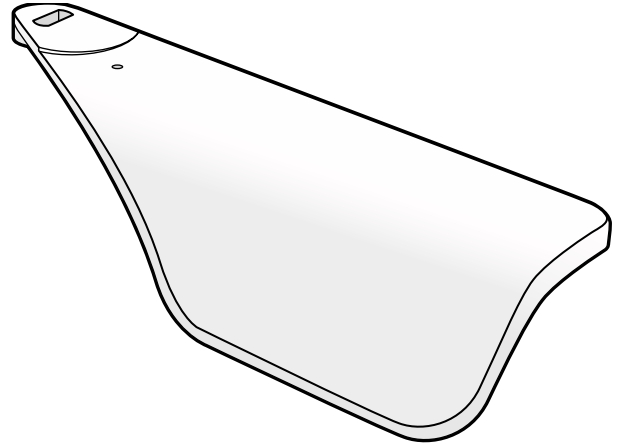

**REFRIGERATION
ICEMAKER
TOO MUCH ICE**

REF 13-04

MAY 2004

Service calls for continuous ice production, too much ice in the bucket, ice cubes overflowing the bucket, ice cubes falling behind the bucket or ice lifting the chiller shelf can now be resolved by installing a redesigned feeler arm.

The new arm is designed with a slight curve to cycle the icemaker "OFF" before the cubes overflow the ice bucket. Order part number WR49X10103.
